Report Overview

Cryogenic electron microscopy (cryo-EM) is an electron microscopic technique that involves freezing the biological sample in order to view the sample with the least possible distortion and the fewest possible artifacts. In cryo-EM, the freezing of the sample is done in ethane slush to produce vitreous, or non-crystalline, ice. The frozen sample grid is then kept at liquid nitrogen temperature in the electron microscope and digital micrographs are collected with a camera. The advantages of cryo-EM over traditional EM techniques include the preservation of the sample in a near-native hydrated state without the distortions from stains or fixatives needed for traditional EM. With image processing and averaging of multiple images, cryo-EM provides high resolution information.

The global Cryo-Electron Microscopy market size was estimated at USD 339 million in 2023 and is projected to reach USD 874.23 million by 2032, exhibiting a CAGR of 11.10% during the forecast period.
