### Report Overview:

Cryoablation is a novel treatment currently used to treat benign breast tumors (called fibroadenomas). Cryoablation is now being studied in patients with certain types of small breast cancer. The treatment places a small probe in the center of the cancer and subsequently uses liquid nitrogen to destroy breast cancer tumors by freezing them. In the treatment of fibroadenomas, cryoablation has proven less invasive and less likely to affect cosmetic appearance than surgery. It could be possible for breast cancer patients to enjoy the same benefits in the future.
