Abstracts

The cryoballoon ablation system is a minimally invasive medical device used primarily for the treatment of atrial fibrillation (AFib), a common cardiac arrhythmia, by delivering cryothermal energy through a balloon catheter to isolate the pulmonary veins and disrupt abnormal electrical signals in the heart. This technology offers advantages over traditional radiofrequency ablation, including shorter procedure times, a more predictable lesion formation, and a potentially lower risk of complications such as perforation or thrombus formation, making it an increasingly preferred option among electrophysiologists for certain patient populations.

The global Cryoballoon Ablation System market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
