## Abstracts

Cryoballoon is a medical tool that uses freezing technology to destroy specific abnormal tissues in the body. It uses the principle of evaporation and heat absorption of freezing to take away tissue heat, so that the temperature of the myocardial tissue at the target ablation site is reduced, and the myocardial cells are destroyed, thereby preventing the abnormal electrical signal transmission and achieving the treatment purpose.

Cryoballoon ablation is mainly used for electrophysiological treatment of the heart, especially for certain types of arrhythmias, such as atrial flutter and atrial fibrillation (AF). This technology restores normal heart rhythm by freezing and subsequently eliminating cells in the heart that cause abnormal electrical activity. Cryoballoon ablation can also be used as a first choice or alternative treatment for certain small and early-stage tumors, such as cancers of the kidney, liver, and prostate. By directly freezing tumor cells, the technology can reduce or completely eliminate malignant cells and reduce the risk of disease progression. Cryotherapy is also commonly used in dermatology to treat various benign and malignant skin lesions. For example, it can effectively remove warts, scars, and certain skin cancers.

The global Cryoballoon market size was estimated at USD 1165.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
