**Report Overview** 

The dilution refrigerator is a high-end scientific research instrument that can provide an environment close to absolute zero. It is widely used in scientific research fields such as condensed matter physics, material science, particle physics and even astronomical detection. When the mixed solution of 3He and 4He is above 0.86K, the liquid 3He can be dissolved in the liquid 4He in any proportion, but when the temperature of the mixed solution drops below 0.86K, the mixed solution will separate into two phases, which contain more 3He The phase is called concentrated phase, and the phase containing less 3He is called dilute phase. Any temperature lower than 0.86K corresponds to a certain dilute phase and concentrated phase of 3He content, and reaches phase equilibrium. When 3He atoms are removed from the dilute phase, in order to maintain the balance of the two phases, the 3He in the concentrated phase enters the dilute phase through the phase interface to supplement the removed 3He atoms. It can be calculated that the enthalpy and entropy of 3He in the dilute phase are much larger than those in the concentrated phase. Therefore, this dilution process needs to absorb heat, and this endothermic phenomenon is used to make a dilution refrigerator.

The global Cryogenic Dilution Refrigerators market size was estimated at USD 211 million in 2023 and is projected to reach USD 378.35 million by 2030, exhibiting a CAGR of 8.70% during the forecast period.
