Report Overview:

Cryogenic electron microscopy (cryo-EM) is an electron microscopic technique that involves freezing the biological sample in order to view the sample with the least possible distortion and the fewest possible artifacts.

In cryo-EM, the freezing of the sample is done in ethane slush to produce vitreous, or non-crystalline, ice. The frozen sample grid is then kept at liquid nitrogen temperature in the electron microscope and digital micrographs are collected with a camera.

The advantages of cryo-EM over traditional EM techniques include the preservation of the sample in a near-native hydrated state without the distortions from stains or fixatives needed for traditional EM. With image processing and averaging of multiple images, cryo-EM provides high resolution information.

The Global Cryogenic Electron Microscope Market Size was estimated at USD 399.37 million in 2023 and is projected to reach USD 490.93 million by 2029, exhibiting a CAGR of 3.50% during the forecast period.
