## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cryogenic Vials for Biological Samples competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global sales of cryogenic vials for biological samples reached 4.77 billion units, with an average selling price of US\$196 per thousand units. Cryopreservation tubes for biological samples are single-use cryogenic containers made with medical-grade/FDA-approved polypropylene (PP) or cyclic olefin copolymers (COC/COP) for the tube body and thermoplastic elastomer (TPE) co-molded caps. They are manufactured in an ISO Class 7 cleanroom and sterilized by  $\gamma$  irradiation (SAL 10<sup>-6</sup>). These tubes can be cycled long-term within a temperature range of -198 °C to +121 °C, and feature 95 kPa leak-proof performance, 17530g centrifugation capability, 100% side code readability, and are free from DNase/RNase/human DNA/ATP/cytotoxicity/hemolysis. They are used for the cryogenic storage, transportation, and automated management of biological samples such as cells, plasma, serum, tissues, and DNA/RNA. The cost structure of cryovials for biological samples exhibits a "high cost in both materials and cleanliness": medical-grade PP particles account for approximately 20% of the cost (22%), energy consumption and depreciation in a Class 100,000 cleanroom account for 19%, and gamma irradiation and enzyme-free/sterile validation account for 14%, totaling over 55%; the remainder is for mold amortization, automated production labor, laser marking/gradation/QR code marking, and compliant packaging.

The global Cryogenic Vials for Biological Samples market size was estimated at USD 936.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
