Abstracts

A cryopreservation freezer is a specialized freezer designed to store biological samples, such as cells, tissues, and embryos, at extremely low temperatures to preserve their viability and integrity. This process, known as cryopreservation, typically involves cooling the samples to temperatures as low as -80°C or even -196°C (using liquid nitrogen) to halt cellular activity and prevent ice crystal formation that could damage the samples. Cryopreservation freezers are used in various fields, including healthcare, biotechnology, and research, allowing for the long-term storage and transport of biological materials for later use, such as in medical treatments, IVF procedures, or scientific studies.

The global Cryopreservation Freezer market size was estimated at USD 568.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
