Abstracts

Cryosurgery closed probes are medical devices designed for minimally invasive tissue ablation procedures, utilizing extreme cold delivered through a sealed system to destroy targeted abnormal or diseased tissues, such as tumors, warts, or precancerous lesions, without direct contact between the cryogen and the patient. These probes feature an integrated cooling mechanism, often employing gases like liquid nitrogen or argon, which circulates within a closed tip to achieve precise temperature control, ensuring localized treatment while minimizing risks of contamination, cross-infection, or unintended tissue damage. They are commonly used in specialties such as dermatology, oncology, gynecology, and ophthalmology, offering advantages in precision, safety, and reduced recovery times compared to open cryosurgery systems or alternative ablation techniques.

The global Cryosurgery Closed Probe market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
