## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Crystalline Manganite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Crystalline manganite refers to a class of mixed-valence manganese oxides, known for exhibiting colossal magnetoresistance, ferroelectricity, and strong electron-lattice coupling. These materials are synthesized through solid-state reactions, sol-gel, hydrothermal, or pulsed laser deposition processes using raw materials like lanthanum oxide, strontium carbonate, manganese dioxide, and oxygen. The supply chain of crystalline manganite involves upstream suppliers of rare earth and alkaline earth oxides, midstream manufacturers specializing in powder synthesis, crystal growth, and sintering, and downstream integrators producing magnetoresistive sensors, spintronic devices, solid oxide fuel cells, and magnetic refrigeration components for electronics, automotive, and energy sectors. In 2024, global crystalline manganite output reached about 210,000 tons with a capacity of 250,000 tons. Prices range from USD 2,800-6,500 per ton depending on phase and purity, and the market holds a 31% gross margin.

The global Crystalline Manganite market size was estimated at USD 742.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
