Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on CT Bronchial Tree Model competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global CT Bronchial Tree Model production reached approximately 83,293 units, with an average global market price of around US\$ 583 per unit. A CT Bronchial Tree Model is a three-dimensional representation of the human bronchial tree constructed based on computed tomography (CT) scan data. It reproduces the detailed branching structure of the trachea, main bronchi, secondary and tertiary bronchi, and bronchopulmonary segments, allowing accurate visualization of airway anatomy.

Gross Profit Margin Analysis The gross profit margin of the CT bronchial tree model industry remains at a medium-to-high level overall, but there are significant differences between different product types. Basic teaching models mainly use PVC or injection-molded materials, with low production costs and a unit price generally between \$100 and \$300, resulting in a gross profit margin of approximately 35%-45%. High-fidelity silicone or 3D-printed custom models, due to their realistic materials, detailed segmentation, and customizable lesion structures, can be priced between \$800 and \$2,000, with a gross profit margin typically between 55% and 65%. Some manufacturers further enhance profit margins by combining physical models with digital teaching software and AR/VR platforms, forming a "model + digital content" composite sales model. With the increasing sophistication of medical education and clinical training needs, high-end models are gradually becoming the main source of industry gross profit.

Key Drivers The growth of the CT bronchial tree model market is primarily driven by educational, clinical training, and research needs. First, the continued growth in demand for respiratory system teaching and anatomical models from global medical schools, nursing schools, and continuing medical education institutions supports the sales volume of basic

models. Secondly, clinical skills training demands high-precision models for simulation training in bronchoscopy and endotracheal intubation, driving the expansion of mid-to-high fidelity products. Thirdly, increased applications by pharmaceutical companies and research institutions in respiratory disease research, drug inhalation formulation development, and lesion model research provide new growth opportunities for the industry. Furthermore, policies in many countries promoting the standardization of medical education and the construction of simulation centers also provide strong support for the long-term development of the CT bronchial tree model market.

The global CT Bronchial Tree Model market size was estimated at USD 48.56 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
