Abstracts

Computed tomography (CT) and digital X-ray equipment (DR) are one of the main medical imaging equipment. Among medical imaging equipment, the X-ray tube is a device used to generate X-rays, which directly affects the imaging quality and service life of CT and DR. The CT tube, also known as the X-ray tube or tube ball, is used to generate X-rays and is the core component of the X-ray generator. The CT tube is not only the signal source carrier of the CT equipment, but also the "high-value consumables" of the CT equipment. The CT and DR tube components include the tube shell assembly, rotor assembly, bearing sleeve, cathode parts, etc. The tube shell assembly is used to support the cathode and anode and form a vacuum to provide conditions for the generation of X-rays. Therefore, it has extremely high requirements for non-magnetism and airtightness. It needs to meet the requirements that after 100 cycles of thermal shock at 20~500°C, the vacuum leakage rate is less than 5×10^{-11} Pa.m³/s, and the thermal radiation coefficient of the internal coating in the infrared band is greater than 0.8. The rotor assembly is used to carry the anode target and make it rotate at high speed (10,000 rpm) to prevent electrons from gathering and bombarding the anode target, causing local melting and failure. Therefore, the material is required to have extremely low gas content, extremely low microstructural defects, and reliable weld quality and machining accuracy. The bearing sleeve is used to support the bearing and protect the high-speed bearing. After the thermal shock test, the vacuum leakage rate is less than 5×10^{-11} Pa.m³/s, and the service life is more than 200,000 scanning seconds. Therefore, the bearing sleeve needs to have high mechanical properties. The cathode part is used to support the tungsten filament that generates electrons, focus the electron beam, and make the electron beam have a certain shape and size to bombard the target surface to produce X-rays with a focus. Therefore, it needs to be resistant to high temperatures and have a long life.

The global CT and DR Tube Components market size was estimated at USD 1428.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
