Abstracts

A cuffed endotracheal tube is a medical device designed for insertion into the trachea to establish and maintain a patient's airway, primarily during general anesthesia, critical care, or emergency respiratory support. It consists of a flexible tube with an inflatable cuff near its distal end, which, when sealed against the tracheal wall, prevents air leakage and aspiration of gastric or oropharyngeal contents into the lungs. This cuff allows for positive pressure ventilation, improves gas exchange efficiency, and enhances patient safety by isolating the respiratory tract. Available in various sizes, materials (such as polyvinyl chloride), and designs?including features like high-volume/low-pressure cuffs to reduce tracheal mucosal injury?the device is essential in settings requiring secure airway management. Its use is standard in operating rooms, ICUs, and pre-hospital care, balancing the need for effective ventilation with minimizing complications like barotrauma or ventilator-associated pneumonia.

The global Cuffed Endotracheal Tube market size was estimated at USD 1150.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
