Abstracts

Cuga sputtering targets are highly specialized materials used in physical vapor deposition (PVD) processes, specifically magnetron sputtering, where they serve as the source material for depositing thin films of copper-gallium (CuGa) alloys onto substrates. These targets are fabricated with precise elemental composition and high purity to ensure consistent film properties, such as electrical conductivity, adhesion, and compositional uniformity, which are critical in applications like photovoltaics (e.g., CIGS?copper indium gallium selenide?solar cells), semiconductor devices, and advanced optics. The performance of Cuga sputtering targets is heavily dependent on metallurgical quality, including grain structure, density, and surface finish, as these factors directly influence deposition rates, film homogeneity, and defect levels in the coated layers.

The global Cuga Sputtering Target market size was estimated at USD 320.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
