Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on CuNiAu Bumping competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. CuNiAu bumping refers to a high-reliability, multi-layer metallization process used in advanced semiconductor packaging, where a copper (Cu) pillar is formed on the wafer surface, followed by a nickel (Ni) barrier layer and a gold (Au) capping layer. This bumping structure offers excellent electrical conductivity, oxidation resistance, and thermal stability, making it ideal for fine-pitch interconnects and advanced integration schemes. CuNiAu bumps are typically fabricated via electroplating and can be classified into standard-size bumps (>100µm), micro-bumps (40-100µm), and ultra-fine-pitch bumps (
