Abstracts

Cured-in-Place Pipe (CIPP) lining services refer to a trenchless method of rehabilitating existing pipelines, typically used for sewer, water, and other underground pipe systems. In this process, a flexible liner, usually made of fiberglass or felt impregnated with a resin, is inserted into the damaged or deteriorating pipe. The liner conforms to the shape of the host pipe, either through inversion (pushing the liner into the pipe from one end while it inverts as it moves through) or by pulling it through. Once in place, the resin within the liner is cured, often through the application of heat (using hot water, steam, or infrared), ultraviolet light, or ambient temperature curing over time. As the resin hardens, it creates a new, smooth, and structurally sound pipe within the existing one. This eliminates leaks, cracks, and other defects, restoring the pipeline's functionality, increasing its lifespan, and improving its flow capacity. CIPP lining services are highly beneficial as they avoid the need for extensive excavation, reducing disruption to traffic, property, and the environment, and can be completed relatively quickly compared to traditional pipe replacement methods.

The global Cured-in-Place Pipe (CIPP) Lining Services market size was estimated at USD 1076.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
