Abstracts

Current feedback operational amplifiers (CFB op amps) are a class of high-speed analog integrated circuits distinguished by their architecture, which employs a current feedback mechanism rather than the voltage feedback used in traditional op amps. This design enables superior performance in high-frequency applications, characterized by wide bandwidth that remains largely independent of closed-loop gain, fast slew rates, and low distortion, making them particularly suitable for video signal processing, high-speed data acquisition, communications systems, and active filter designs where signal integrity and speed are critical. Unlike voltage feedback amplifiers, CFB op amps maintain constant bandwidth across varying gains, offering designers greater flexibility in high-speed analog circuit implementations while trading off some precision in DC characteristics.

The global Current Feedback Op Amps market size was estimated at USD 152.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
