## Abstracts

The curved bipolar electrocoagulation forceps is a medical device consisting of a double-flap forceps body and an electrode holder. The forceps body is designed to be curved so that it is easier to reach and operate in areas that are difficult to reach during surgery, such as the nasopharynx and other areas with complex natural anatomical morphology. The electrode holder is equipped with a high-frequency input plug, which is used in conjunction with a high-frequency surgical instrument for electrocoagulation and hemostasis during surgery. The curved bipolar electrocoagulation forceps are particularly suitable for fine surgical fields such as otolaryngology and ENT. For example, in nasopharyngeal surgery, the curved bipolar electrocoagulation forceps can more easily reach the bleeding points at higher positions in the nasopharynx and achieve effective hemostasis.

The global Curved Bipolar Electrocoagulation Forceps market size was estimated at USD 179.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
