Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Custom Abutments competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Implant restoration basically consists of three parts: the implant itself, the abutment and the crown. The abutment connects the implant and the crown, and transmits the force of the crown (for example, through chewing movement) to the implant, and then to the jawbone. This makes the abutment crucial in terms of force transmission, position fixation, tissue shaping and aesthetics. As a component that connects the implant and the crown, the abutment plays an important role in the subsequent performance of the implant. According to different processing methods, it can be divided into finished abutments and personalized abutments. Compared with finished abutments with highly standardized parameters, personalized abutments can be customized according to the specific conditions in the patient's oral cavity. Generally, computer-aided design and manufacturing (CAD/CAM) is used to make them according to the three-dimensional position of the implant and the three-dimensional space of the missing teeth gap. While helping patients repair missing or missing teeth and restore chewing function, it better guarantees the patient's comfort and social aesthetic needs. Personalized abutment products are usually made of TA4G pure titanium, TC4 or TC4ELI titanium alloy that meets the GB/T 13810 standard. The abutment structure can be roughly divided into the upper interface part, the cuttable part, and the lower interface part.

The global Custom Abutments market size was estimated at USD 1121.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
