## Abstracts

An orthotic insole is a product that changes the surface of the shoe to fit the wearer's individual foot shape. Just as many people need to wear glasses, people with lower extremity biomechanical abnormalities or mechanical foot problems caused by these abnormalities need to wear corrective products - orthopedic foot insoles. Orthotics are designed based on the biomechanics of the foot and the structure allows a wide range of modifications and deflections to be created and incorporated into the orthotic, making it a customizable orthotic that can be molded in plaster and fixed directly to the patient's foot, providing enough space and protection for feet. The global medical device market is estimated to be US\$603.3 billion in 2023, with a compound annual growth rate of 5% expected in the next six years. Global health care expenditure currently accounts for approximately 10% of global GDP, and the proportion will continue to increase in the next few years. This is primarily due to the increasing demand for healthcare from an aging population, the rising prevalence of chronic and infectious diseases, and the expansion of emerging markets. The medical device market plays an important role in the healthcare spending industry. The medical device market is driven by a variety of factors, including increasing global demand for advanced medical services, advancements in medical technology, growing geriatric population, increasing medical expenditures, and increasing awareness of early stage disease diagnosis and treatment.

The global Customized Insoles for Feet market size was estimated at USD 418.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
