Report Overview

Cutaneous leishmaniasis is the most common syndrome and can produce ulcers that have the potential of stimulating a periosteal reaction if the ulcer occurs near bone.

Leishmaniasis, a protozoal infection transmitted by sandfly bite, produces a clinical spectrum of disease ranging from asymptomatic infection to ulcerative skin and mucosal lesions to visceral involvement. Leishmaniasis is endemic in regions of Africa, the Middle East, south Asia, southern Europe, northern South America, and Central America. There has been an increase in imported leishmaniasis into developed, non-endemic countries due to increasing global travel.
