## Abstracts

Cutting fluid filter paper is a filter material specially used for filtering cutting fluid. It is usually made of cellulose, synthetic fiber or glass fiber, with a specific pore size and filtration accuracy. It can effectively remove impurities, metal debris, oil, microorganisms and other pollutants in the cutting fluid, keep the cutting fluid clean, extend its service life, and ensure the smooth progress of the cutting process. Cutting fluid filter paper generally has a high filtration efficiency and can filter out a large number of tiny particles of impurities within a certain period of time. At the same time, it has good water resistance, chemical corrosion resistance and a certain strength to adapt to the working environment of the cutting fluid. During the filtration process, it will not be deformed, damaged or dissolved due to contact with the cutting fluid, ensuring the stability and reliability of the filtration effect.

The global Cutting Fluid Filter Paper market size was estimated at USD 296.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
