Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cutting Mill competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Cutting Mill reached approximately 11,500 units, with an average selling price of approximately US\$8,200 per unit. The single-line production capacity is approximately 600 units per year, with an average gross profit margin of approximately 30-42%. Cutting Mill utilizes cutting and shearing principles to rapidly and gently pulverize soft, medium-hard, tough, fibrous, and synthetic material samples. Through the interaction between the high-speed rotating blade and the cutting edges, the sample is continuously cut to a size smaller than the bottom sieve aperture before being discharged, quickly obtaining the desired particle size. This process also minimizes excessive heat generation, making it suitable for processing heat-sensitive samples. The upstream supply chain primarily comprises the core raw materials and components required for its manufacturing, such as stainless steel for the machine body and grinding chamber, tool steel and carbide for the high-strength rotating blade, electronic components for the control system, and polymer materials such as seals. Its downstream application industries focus on scientific research and analytical testing, including sample preparation in the pharmaceutical, food, materials science, and plastics and chemical industries.

The global Cutting Mill market size was estimated at USD 94.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
