## Abstracts

The heat dissipation of semiconductor lasers is directly related to the performance of semiconductor lasers. At present, the main way of heat dissipation for semiconductor lasers is through heat sinks. Using diamond as a heat sink material has become one of the important applications in the field of semiconductor lasers. In high-power semiconductor lasers, commonly used heat sink materials for packaging include AlN and Cu. Among them, AlN is difficult to achieve good heat dissipation due to its low thermal conductivity. CVD diamond is an excellent heat sink material, and its thermal conductivity can reach up to 2000W (K-m), which is much larger than AlN and Cu. As a heat sink, diamond exhibits excellent heat dissipation characteristics: on the one hand, the heat concentrated on the PN junction of the device can be evenly and rapidly diffused along the surface of the heat sink; on the other hand, the heat is quickly conducted along the vertical direction of the heat sink. The global core companies of CVD diamond heat sinks mainly include Element Six, A. L. M. T. Corp., Coherent, Leo Da Vinci Group, Applied Diamond, Inc. and Appsilon Scientific. Among them, the share of TOP6 companies exceeds 64%.

The global CVD Diamond Heat Sink (Submount) market size was estimated at USD 99.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
