Abstracts

Zinc sulfide (ZnS) is a material with uniform refractive index and good consistency, and has good image transmission performance in the 8-12 μ m band. CVD zinc sulfide (ZnS) is a chemically inert material. It has the characteristics of high purity, insoluble in water, moderate density, and easy processing. It is widely used in the production of infrared windows, fairings and infrared optical components. In the development of zinc sulfide (ZnS) materials, the CVD (chemical vapor deposition) method is moving towards high efficiency, low cost and multi-functionality. With the research and development of new precursors, the controllability of the deposition process and the quality of materials are expected to be significantly improved. At the same time, advances in doping technology will make it possible to optimize the optoelectronic properties of ZnS, promoting its widespread use in applications such as LEDs, lasers, and photodetectors. The CVD zinc sulfide (ZnS) market has shown a steady growth trend in recent years, driven mainly by increasing demand for optoelectronics and infrared technologies. With the widespread application of photodetectors, lasers and infrared imaging equipment in consumer electronics, security, medical and military fields, the demand for high-performance ZnS materials continues to rise. In addition, with the advancement of new energy technology, the application potential of ZnS in solar cells has gradually been valued. In terms of market competition, major manufacturers focus on the research and development of high-purity and high-quality products to meet rising technical standards and application requirements. In the future, with technological innovation and the development of emerging markets, the application prospects of CVD zinc sulfide will still be broad.

The global CVD Zinc Sulfide market size was estimated at USD 87.1 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
