Report Overview

Continuous lasers for biofluorescence microscopy refer to lasers used in biofluorescence microscopes, whose main function is to excite fluorescent dyes in samples to make them emit fluorescent signals, so as to achieve the purpose of imaging and analyzing biological samples. Different from pulsed lasers, CW lasers output continuous wavelength beams with stable power, suitable for long-term fluorescence imaging experiments. At the same time, CW lasers also have higher beam quality and smaller spot size, which can improve imaging resolution and signal-to-noise ratio. Therefore, CW lasers have become a common excitation light source in the field of bioluminescence microscopy.

The global Cw Lasers For Bioluminescence Microscopy market size was estimated at USD 285.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
