The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on CW Lasers for Silicon Photonics competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. CW laser refers to a continuous wave laser that serves as the core light source of silicon photonic modules. It achieves stable laser output by continuously exciting energy and provides continuous wave optical signals for silicon photonic modules. CW lasers continuously convert electrical energy into light energy through the synergy of laser media, pumping systems, and optical resonant cavities, producing stable and continuous laser output. In silicon photonic modules, CW lasers support the development of silicon photonic modules from 100G to 800G and even 1.6T rates with their high stability, long life, and high efficiency, providing low-power, high-density optical interconnect solutions for cloud computing, data center interconnection, and other scenarios. As silicon photonic modules develop towards miniaturization and high performance, the integration of CW lasers and silicon photonic chips has become a trend, providing the possibility of achieving more efficient optoelectronic co-packaged optical technology (CPO).

The global CW Lasers for Silicon Photonics market size was estimated at USD 554.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.40% during the forecast period.
