Report Overview

The CWDM passive components optical filter uses an optical multiplexer at the transmitting end to combine light of different wavelengths into one optical fiber for transmission; at the receiving end of the link, the combined light is decomposed by a demultiplexer and passed through different wavelengths. The fibers are sent to different receivers respectively, so only two fibers can transmit multiple signals. CWDM technology can increase the transmission capacity of the old optical fiber by inserting a new OTU board to expand the capacity, improve the utilization rate of the existing optical fiber resources, and realize the Larger scale data transfer tasks.
