Report Overview

The cyanobacteria sensor uses the absorption and emission peaks of cyanobacteria in the spectrum to emit monochromatic light of a specific wavelength to the water body. After the cyanobacteria in the water absorb the energy of this monochromatic light, they release monochromatic light of another wavelength. The light intensity emitted by the cyanobacteria is proportional to the content of cyanobacteria in the water. By measuring the target parameters based on the fluorescence of the pigment, it is possible to identify algal blooms before they affect the environment.

This report provides a deep insight into the global Cyanobacteria Sensors market covering all its essential aspects. This ranges from a macro overview of the market to micro details of the market size, competitive landscape, development trend, niche market, key market drivers and challenges, SWOT analysis, value chain analysis, etc.
