Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cycling Gas Turbine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.In 2024, global cycling gas turbine production reached 27,259.4 MW, with an average global market price of US$368 per kW. Cycle gas turbines are gas turbine power generation devices that operate on the principle of a thermodynamic cycle. They adapt to power system load fluctuations, can be started and stopped frequently, and flexibly adjust output. They emphasize rapid start and stop capabilities, load-following flexibility, and thermal cycle life management. Their applications are concentrated in power system peak shaving, renewable energy consumption and grid stability, industrial backup and emergency power, and distributed energy combined with cogeneration. The upstream sector includes raw material suppliers (high-temperature alloys, composite materials), core component manufacturers (blades, burners, control systems), and auxiliary equipment suppliers. The downstream sector includes power companies, grid dispatchers, independent power producers, large industrial parks, and regional energy supply systems.Globally, demand for cycle gas turbines is growing rapidly, driven by the large-scale integration of wind and solar power, which has increased the grid's reliance on flexible power sources. The North American market, benefiting from competitive natural gas prices and electricity market mechanisms, has strong demand for cycle gas turbines. In Europe, carbon reduction policies and the increasing proportion of renewable energy are accelerating the deployment of high-efficiency, low-emission, flexible gas turbines. Driven by the dual forces of energy transition and growing electricity demand, the Asia-Pacific region (particularly China, India, Japan, and South Korea) is poised to become the largest new market in the future. Driving factors include the demand for flexible peak regulation brought about by the increase in renewable

energy penetration, the power market reform that promotes the auxiliary service market to recognize the value of fast start and shutdown units, the advancement of gas turbine technology (combustion control, material durability, digital operation and maintenance) that improves the reliability and economy of cycle operation, and the development of hydrogen energy and low-carbon fuels that create conditions for cycle gas turbines to adapt to multi-fuel operation in the future.

The global Cycling Gas Turbine market size was estimated at USD 10031.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
