Report Overview

Cycloplegic agents act by paralysing the iris's sphincter muscle, causing dilation, and by paralysing the ciliary muscle, which inhibits accommodation. Atropine, homatropine, scopolamine, cyclopentolate, and tropicamide are examples of cycloplegic agents. Preventing movement of the iris or ciliary body's dilator and sphincter muscles with cycloplegic drugs often relieves pain in inflammatory conditions such as uveitis and is a standard therapeutic procedure. Furthermore, as a result of the local release of prostaglandins, the iris usually constricts during irritation or inflammation. This makes it easier for adhesions to form with the lens. Cycloplegics also aid in the prevention of this complication.

The global Cycloplegic Agents market size was estimated at USD 1297 million in 2023 and is projected to reach USD 2209.93 million by 2032, exhibiting a CAGR of 6.10% during the forecast period.
