Abstracts

Cyclopropyl methyl ketone (CPMK), also known as 1-cyclopropylethanone, is an organic compound characterized by a cyclopropyl ring directly attached to a carbonyl group (C=O) with a methyl substituent. This structural configuration imparts significant reactivity and steric constraints, making it a valuable synthon in organic synthesis, particularly for the construction of complex molecules, pharmaceuticals, and agrochemicals. Its strained three-membered ring introduces unique electronic and geometric properties that influence reaction pathways, often enabling ring-opening reactions or serving as a key intermediate in the synthesis of cyclopropane-containing bioactive compounds. As a high-purity chemical intermediate, it is primarily utilized in research, development, and industrial-scale production where specific molecular architectures are required.

The global Cyclopropyl Methyl Ketone market size was estimated at USD 105.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
