Report Overview:

Usually, the main body of the cystoscope is an optical fiber, the diameter of the fiber is within about 9 mm, and there is a light source at the top. The cystoscope enters the bladder through the urethra, and transmits the image of the inner wall of the bladder to the eyepiece at the other end of the optical fiber. There are two types of cystoscope: soft cystoscope and hard cystoscope. Flexible cystoscope is used for both male and female patients, and generally only local anesthetics, such as lidocaine, are required for the operation. Rigid cystoscope often causes pain for patients, especially male patients. Therefore, when using a rigid cystoscope, patients often need general anesthetics to relieve pain.
