Abstracts

The market for cytomegalovirus (CMV) treatment encompasses pharmaceutical interventions designed to manage and control infections caused by cytomegalovirus, a common herpesvirus that primarily affects immunocompromised individuals such as organ transplant recipients, HIV/AIDS patients, and neonates. This market includes antiviral drugs like ganciclovir, valganciclovir, foscarnet, and cidofovir, which work by inhibiting viral DNA replication, as well as emerging therapies such as letermovir, which targets the viral terminase complex. Treatment strategies focus on prophylaxis, preemptive therapy, and treatment of established disease, with a growing emphasis on reducing drug toxicity, overcoming resistance, and improving outcomes in high-risk populations. The market is driven by the increasing number of immunosuppressed patients due to rising transplant procedures, advancements in biologic immunosuppressants, and the global burden of HIV, though it faces challenges such as high treatment costs, side effects, and the need for more effective therapeutic options for resistant strains.

The global Cytomegalovirus Treatment market size was estimated at USD 1380.51 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
