Report Overview

Cytotoxic drugs, also known as antineoplastic or anticancer drugs, are a class of pharmaceutical agents specifically designed to target and destroy cancerous cells. These drugs work by interfering with the normal processes of cell division and growth, thereby inhibiting the proliferation of malignant cells. Cytotoxic drugs can be derived from various sources, including natural products, synthetic compounds, and biologic agents. They are typically administered intravenously or orally, and their use is often guided by a comprehensive understanding of the specific type of cancer being treated, the stage of the disease, and the patient's overall health. The effectiveness of cytotoxic drugs can vary, and they may be used alone or in combination with other treatments such as radiation therapy, surgery, or immunotherapy. Due to their potent nature, these drugs can also cause side effects, which may include hair loss, nausea, and damage to healthy cells. The development and use of cytotoxic drugs are critical components of cancer treatment strategies, aiming to improve patient outcomes and survival rates.
