Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Czochralski Monocrystalline Silicon Boat competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The czochralski monocrystalline silicon boat is a high-purity silicon carrier specially used for high-temperature heat treatment processes (such as diffusion, oxidation, annealing, etc.) in semiconductor manufacturing. It is made of single-crystal silicon material grown by the Czochralski (CZ) method. The silicon boat has the same crystal structure and thermal expansion coefficient as the silicon wafer, thereby minimizing the problem of particle shedding or material deformation caused by thermal stress during the heat treatment process. Compared with the quartz boat, the CZ monocrystalline silicon boat performs better in cleanliness, heat resistance, chemical stability and resistance to particle generation, and is particularly suitable for 12-inch wafer production lines with extremely high requirements for pollution control. In addition, it can also reduce cross-contamination caused by differences in boat and wafer materials, and is one of the increasingly popular high-end process carriers in current advanced processes (such as logic chips, DRAM, 3D NAND, etc.).

The global Czochralski Monocrystalline Silicon Boat market size was estimated at USD 144.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
