## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on D-Phenylalanine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global D-Phenylalanine production was approximately 800 tons, with an average selling price of about US\$121/kg. Single-line capacity was approximately 120 tons/year, with an average gross profit margin of approximately 20-30%. D-Phenylalanine is an atypical, enantiomeric chiral intermediate, appearing as a white or grayish-white powder or crystalline solid at room temperature. It has important applications in organic synthesis and biochemistry, particularly in the preparation of pharmaceutical and pesticide intermediates and in the modification of biomolecules. D-phenylalanine also acts as an inhibitor of bacterial biofilm formation and plays a crucial role in research and new drug development. Upstream raw materials mainly include benzaldehyde, hippuric acid, and diethyl acetylaminomalonate used in chemical synthesis and fermentation processes, as well as cinnamic acid or phenylpyruvic acid, substrates required for enzymatic biotransformation. Downstream applications are concentrated in the pharmaceutical, health supplement, and food industries. In the pharmaceutical field, it is used as a chiral synthon in the preparation of antibiotics and diabetes drugs, while in the health supplement field, it is directly used in the formulation of dietary supplements for relieving chronic pain and managing mood.

The global D-Phenylalanine market size was estimated at USD 103.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
