Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on D-Phenylglycine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global D-Phenylglycine production reached approximately 1700 tons, with an average global market price of around US\$50 per kg. D-phenylglycine is a chiral, unnatural amino acid with the molecular formula $C_9H_9NO_2$. It is a benzene-substituted glycine derivative. It appears as a white or off-white crystalline powder, often in the form of the free acid or salts. Its asymmetric carbon atom makes it an optically active compound, most commonly found as a dextrorotatory isomer. D-phenylglycine's greatest industrial value lies in pharmaceutical intermediates, particularly as a key side chain precursor for semi-synthetic penicillins (such as amoxicillin and ampicillin) and some cephalosporins (such as cefdroxil and cefprozil), improving their antimicrobial activity and oral absorption. In addition to antibiotics, it can also serve as a building block for the synthesis of other nitrogen-containing drugs, pesticides, and chiral catalysts. Industrial production typically utilizes chemical synthesis or enzymatic methods, with enzymatic catalysis increasingly gaining attention due to its high enantioselectivity and minimal environmental impact.

The global D-Phenylglycine market size was estimated at USD 85.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global D-Phenylglycine market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
