### Report Overview:

Immersion cooling is an IT cooling practice by which IT components and other electronics, including complete servers, are submerged in a thermally conductive dielectric liquid or coolant. Heat is removed from the system by circulating liquid into direct contact with hot components, then through cool heat exchangers. Fluids suitable for immersion cooling have very good insulating properties to ensure that they can safely come into contact with energized electronic components.

Immersion cooling has the potential of becoming a popular server cooling solution, in particular for green data centers, as it allows operators to drastically reduce their energy usage through the elimination of the expensive air cooling infrastructure including on-board server fans, CRACs, A/C compressors, air-circulation fans, necessary duct work, air handlers, and other active ancillary systems such as dehumidifiers. These systems are replaced with efficient low speed liquid circulation pumps and heat exchanger and/or dry cooler systems. The power reduction that can be achieved through the use of immersion cooling is often measured in terms of Power Usage Effectiveness (PUE).

The Global Data Center Liquid Cooling Market Size was estimated at USD 1588.31 million in 2023 and is projected to reach USD 3970.92 million by 2029, exhibiting a CAGR of 16.50% during the forecast period.
