The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Data Center PCB competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Data Center PCB (Printed Circuit Board) refers to the specialized circuit boards used in data center equipment, such as servers, storage systems, network switches, routers, and power management units. These PCBs serve as the electrical backbone that connects and supports critical electronic components like processors, memory modules, and power converters, enabling high-speed data transmission and reliable system performance. In 2024, global Data Center PCB production reached approximately 556.8 k units, with an average global market price of around US\$ 560 USD per units. The production capacity for Data Center PCB in 2024 was approximately 580 k units. The typical gross profit margin for Data Center PCB is between 20% and 35%. The upstream of data center PCBs mainly consists of PCB raw material suppliers (such as high-performance copper-clad laminates, epoxy resins, copper foils, conductive pastes), precision manufacturing equipment suppliers, and electronic component suppliers, providing the essential materials and components for PCB production. The downstream primarily includes data center server manufacturers, storage device makers, and network equipment vendors, who integrate these PCBs into server motherboards, switch backplanes, storage control boards, and other core modules to support high-density computing and high-speed data transmission.

The global Data Center PCB market size was estimated at USD 312.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
