Abstracts

Data centre virtualization refers to the process of creating a virtualized rather than physical representation of data centre resources, including servers, storage, networks, and other infrastructure components, through the use of specialized software that abstracts, pools, and automates these resources to optimize utilization, improve scalability, and streamline management. By decoupling workloads from underlying hardware, this approach enables greater operational flexibility, reduces capital and operational expenditures, enhances disaster recovery capabilities, and supports dynamic resource allocation in response to fluctuating demands, making it a foundational technology for modern cloud computing, hybrid IT environments, and software-defined data centres.

The global Data Centre Virtualization market size was estimated at USD 10775.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.75% during the forecast period.
