Report Overview

A data diode is a unidirectional network communication device that enables the safe, one-way transfer of data between segmented networks. Data diode design maintains physical and electrical separation of source and destination networks, establishing a non-routable, completely closed one-way data transfer between networks. Data diodes effectively eliminate external points of entry to the sending system, preventing intruders and contagious elements from infiltrating the network. Securing all of a network's data outflow with data diodes makes it impossible for an insecure or hostile network to pass along malware, access your system, or accidentally make harmful changes.

The global Data Diode Security Products market size was estimated at USD 319.90 million in 2023 and is projected to reach USD 968.67 million by 2032, exhibiting a CAGR of 13.10% during the forecast period.
