Abstracts

A data line common mode choke is an inductive component designed to suppress electromagnetic interference (EMI) and radio frequency interference (RFI) in electronic circuits by impeding high-frequency common mode noise currents while allowing differential mode signals to pass with minimal attenuation. It typically consists of a magnetic core, such as ferrite, wound with multiple coils through which the data or signal lines pass, creating high impedance to unwanted noise currents that flow in the same direction on both conductors while offering low resistance to the desired differential signals. These chokes are widely employed in applications including USB, Ethernet, HDMI, and other high-speed data transmission systems to ensure signal integrity, comply with electromagnetic compatibility (EMC) regulations, and prevent data corruption or system malfunctions caused by external or internally generated noise.

The global Data Line Common Mode Choke market size was estimated at USD 485.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
