Report Overview

The DC governor is a device that adjusts the speed of the DC motor. The upper end is connected to the AC power source, and the lower end is connected to the DC motor. The DC governor converts the AC power into two output DC power sources, one input is for the DC motor magnetization (stator), and the other is Input to the armature (rotor) of the DC motor, and the DC governor adjusts the speed of the DC motor by controlling the DC voltage of the armature. At the same time, the DC motor gives a feedback current to the governor, and the governor judges the speed of the DC motor according to the feedback current, and corrects the armature voltage output if necessary, so as to adjust the speed of the motor again.
