Abstracts

DDR4 computer memory sticks, or dual in-line memory modules (DIMMs), are a type of volatile random-access memory (RAM) used in computing devices such as desktops, laptops, and servers to temporarily store data that the CPU needs to access quickly; they represent the fourth generation of Double Data Rate (DDR) SDRAM technology, offering higher transfer speeds, greater bandwidth, and improved power efficiency compared to earlier DDR3 modules, with standard operating voltages reduced to 1.2V and data rates ranging from 1600 MT/s to 3200 MT/s or higher in overclocked variants. These modules are characterized by their 288-pin design for desktops and 260-pin SO-DIMMs for laptops, and they remain a critical component in systems where multitasking, gaming, content creation, and data processing require fast, responsive memory performance, though they are gradually being superseded by DDR5 in newer high-end platforms.

The global Ddr4 Computer Memory Stick market size was estimated at USD 5700.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -7.50% during the forecast period.
