Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on DDR4 Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A DDR4 module is a memory module based on DDR4 SDRAM (dynamic random access memory) chips, assembled into a standard DIMM (or SO-DIMM) format. It is used as main memory in desktop computers, laptops, servers, or embedded systems. By 2024, global DDR4 module shipments are expected to reach approximately 200 million units (about 200 million pcs), with an average price of approximately US\$8 per module. Top manufacturers can achieve an annual production capacity of 15 to 20 million modules per production line. The upstream industry includes DRAM chip manufacturing, silicon wafers, packaging and testing, PCBs, and passive component supply, while the downstream industry includes system manufacturers, server manufacturers, workstation manufacturers, and embedded device manufacturers. A simple analogy for downstream consumption is this: assuming a server is equipped with 512GB of memory and uses 32GB modules, 16 modules will be consumed. Therefore, $512\text{GB}/32\text{GB} = 16$ modules, representing the amount "consumed" by the downstream module manufacturer. Regarding gross profit margins, DDR4 module manufacturers can expect to earn 15% to 25% during market booms, but this can drop to 5% to 10% during periods of oversupply.

The global DDR4 Module market size was estimated at USD 1600.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
