Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on DDR4 and DDR5 Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.DDR4 and DDR5 modules are products that combine DDR4 or DDR5 generation DRAM memory chips through packaging, testing, assembly, and modularization (including the addition of a PCB, controller, SPD/PMIC, etc.) to form standardized memory modules for use in complete computers or systems. Total shipments of these modules are expected to be around 150 million in 2024, with an average price per module of approximately US$75. A single production line (a high-end module manufacturer's DDR4/DDR5 module line) typically has an annual production capacity of 1 million to 1.5 million modules. The upstream industry includes DRAM chip manufacturers, wafer fabs, packaging/testing facilities, PCB substrate manufacturers, passive component manufacturers (resistors, capacitors, EMI filters), and module controller designers; the downstream industry includes PC manufacturers, server manufacturers, workstation manufacturers, and high-performance system integrators. For example, if a server requires 512GB of memory and uses 32GB modules, 16 modules will be consumed. These 16 modules represent the manufacturer's consumption for the server system. Regarding gross profit margins, DDR4/DDR5 module manufacturers can achieve 12% to 20% in good market conditions. However, during periods of intense price competition or weak demand, this can drop to 5% to 10%.Currently, with the development of technology, DDR5 has become the inevitable direction of memory technology development due to its advantages in high frequency, high bandwidth, large capacity, energy efficiency and future compatibility. However, at present, DDR4 prices have skyrocketed due to reduced production capacity, while DDR5 prices have steadily declined, and the relationship between the two has

undergone a historic reversal. From the perspective of market dynamics, the three major storage giants are turning to DDR5/HBM, and DDR4 will gradually withdraw from the mainstream market. Despite this, DDR4 still has strong demand in some specific areas, such as industrial control systems and automotive electronic basic modules. In addition, the penetration rate of DDR5 is continuing to increase, and its overall penetration rate is expected to continue to rise in 2025.

The global DDR4 and DDR5 Module market size was estimated at USD 11250.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.20% during the forecast period.
