### Report Overview

De-agglomeration equipment refers to specialized machinery or processes used to break down or disperse agglomerated solids or groups of particles into individual particles. Agglomerates are formed when fine particles or powders adhere to each other, resulting in larger, more compact structures. De-agglomeration equipment is employed in a wide range of industries to improve material flow, increase surface area, and facilitate further processing of agglomerated materials. De-agglomeration equipment comes in various forms depending on the specific application and characteristics of the material being processed. Some common de-agglomeration equipment includes rotor mills, pin mills, hammer mills, disintegrators, and high-shear mixers. These machines apply mechanical force, impact, or shear to break down agglomerates and disperse the particles, resulting in smaller particle sizes or individual particles.
