Report Overview

Dead Burnt Magnesia (DBM) is a high-purity refractory material derived from the calcination of magnesite (magnesium carbonate) at temperatures exceeding 1,700°C, resulting in a dense, stable form of magnesium oxide (MgO) with minimal reactivity and high resistance to thermal shock, corrosion, and basic slag erosion. It is primarily used in steelmaking (lining furnaces, ladles, and converters), cement production (kiln linings), and non-ferrous metal industries due to its exceptional thermal stability (withstanding temperatures up to 2,800°C) and mechanical strength. DBM is classified by purity (typically 90-98% MgO), grain size distribution (coarse/fine), and bulk density, with higher grades preferred for critical high-temperature applications. The material's performance hinges on controlled sintering processes to minimize impurities like silica and calcium oxide, which can degrade refractory properties.

The global Dead Burnt Magnesia market size was estimated at USD 500.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
