Report Overview:

Deaeration is the removal of air molecules, usually steam, from another gas.

A deaerator is a device that is widely used for the removal of air and other dissolved gases from the feedwater to steam generating boilers. In particular, dissolved oxygen in boiler feed waters will cause serious corrosion damage in steam systems by attaching to the walls of metal piping and other metallic equipment and forming oxides (rust). It also combines with any dissolved carbon dioxide to form carbonic acid that causes further corrosion. Most deaerators are designed to remove oxygen down to levels of 7 ppb by weight (0.0005 cm³/L) or less.

The Global Deaerator Systems Market Size was estimated at USD 4074.79 million in 2023 and is projected to reach USD 5429.48 million by 2029, exhibiting a CAGR of 4.90% during the forecast period.
